Erectile Dysfunction Concerns? – E-Shot is your Key

Nooshin K. Darvish, ND, ABAAHP

June 18, 2021

Approximately 52% of men between the ages of 40 and 70 suffer from erectile dysfunction (ED). ED is a circulatory problem complicated further by diabetes and heart disease as well as hormonal imbalance.

The rippling effects of ED can be devastating for marriages, relationships, and families, often creating a lack of confidence at the workplace leading to financial and economic problems. Current medications, such as Viagra or Cialis, do not resolve the concern and often cause several side effects. The penile pump by itself is not effective either.

So what is a man to do?

The simple answer is here: the E-Shot. The E-Shot utilizes platelet-rich plasma (PRP) from your own blood. PRP is rich in seven growth factors that stimulate tissue and circulation regeneration. The painless procedure takes only a few minutes and leads to an enlarged and engorged male equipment.
